

GROUP ACTIVITY: MODULE 9 (SCRIPT)

Common Cyber Attacks

Presenter 1 – ESPAÑOLA (1 minute)

“Good day everyone. Our group will be discussing Common Cyber Attacks, which are malicious actions performed by cybercriminals to steal information, damage systems, or disrupt online services. As technology becomes more integrated into our daily lives, cyber-attacks are becoming more frequent and dangerous. These attacks can affect individuals, businesses, and even governments. Understanding common cyber-attacks helps us become more aware and prepared to protect our digital information. In this presentation, we will discuss phishing, malware, password attacks, denial-of-service attacks, and ransom ware.”

Phishing Attacks

Presenter 2 – QUIOYO (1 minute)

“Phishing is one of the most common cyber-attacks today. It involves fake emails, messages, or websites that look legitimate and are designed to trick users into giving away personal information such as usernames, passwords, or bank details. These messages often create a sense of urgency, like claiming your account will be locked. Once the attacker gets the information, they can access private accounts or steal money. Phishing attacks are commonly used because they exploit human trust rather than technical weaknesses.”

Malware Attacks

Presenter 3 – ESTIRA (1 minute)

“Malware refers to malicious software designed to harm or control computer systems. Common types of malware include viruses, worms, trojans, and spyware. Malware can enter a system through infected email attachments, unsafe downloads, or malicious websites. Once installed, it can delete files, steal sensitive data, or allow attackers to control the device remotely. Malware attacks show why it is important to keep software updated and use reliable antivirus protection.”

Password Attacks and Denial-of-Service Attacks

Presenter 4 – DERES (1 minute)

“Password attacks happen when cybercriminals try to gain access to accounts by guessing or stealing passwords. Techniques such as brute force attacks attempt many password combinations until the correct one is found. Another common attack is the Denial-of-Service or DoS attack, where attackers flood a website or system with excessive traffic. This causes the system to slow down or crash, making services unavailable to users. These attacks highlight the need for strong passwords and proper network security.”

Ransom ware

Presenter 5 – OGALINA (1 minute)

“Ransom ware is a serious type of malware that encrypts a victim’s files and demands payment to restore access. It can affect individuals, businesses, and hospitals, causing major disruptions. Most ransom ware attacks spread through phishing emails or malicious downloads. To conclude, common cyber-attacks such as phishing, malware, password attacks, DoS attacks, and ransomware continue to increase. By being aware of these threats and practicing good cyber security habits, we can reduce risks and better protect our digital systems. Thank you.”
