

MODULE 9 — COMPUTER AND INTERNET CRIME IN IT

Name: DENNIEL M. ESTIRA

Course/Section: BSIT 4-1

Date: 12/19/2025

PART 1 — Understanding Key Concepts (10

pts) *Define the following terms.*

1. Cybercrime

Cybercrime includes illicit operations including hacking, identity theft, online fraud, and malware distribution that are done using computers, networks, or the internet.

2. Security Incident

A security incident is any event that compromises or threatens the confidentiality, integrity, or availability of information or information systems.

3. Confidentiality

Confidentiality ensures that information is accessible only to authorized individuals and protected from unauthorized access or disclosure.

4. Integrity

Integrity refers to maintaining the accuracy, consistency, and trustworthiness of data by preventing unauthorized modification or alteration.

5. Availability

Availability ensures that information systems and data are accessible and usable by authorized users whenever needed.

PART 2 — Identify the Threat (10 pts)

Write the letter of the correct type of exploit.

A. Malware B. Phishing C. Social Engineering D. Zero-day Exploit

1. An attacker pretends to be IT staff and asks for your password.

Answer: C

2. An email asks you to “verify your bank account” by clicking a link.

Answer: B

3. A new vulnerability is attacked before any fix is available.

Answer: D

4. A downloaded file encrypts all your documents and demands payment.

Answer: A

PART 3 — Computer Forensics Task (15 pts)

List three ways computer forensics can help resolve a security incident. Explain why each one is important.

1. By examining logs, files, and system activity, computer forensics assists in figuring out how the security incident happened. This is crucial because identifying the underlying reason stops the same attack from occurring in the future.
2. Forensics guarantees that digital evidence is appropriately gathered and kept unaltered. Legal investigations, disciplinary measures, and making sure the evidence is accepted in court all depend on this.

3. Computer forensics can track the actions taken by the attacker as well as the data that was stolen, altered, or accessed. Assessing damage, recovering data, and bolstering system defenses all depend on this.

PART 4 — Prevention Strategies (10 pts)

List five prevention strategies discussed in the module and explain how each helps prevent cybercrime.

1. Using multi-factor authentication (MFA) and secure passwords

by making it more difficult for hackers to access accounts even in the event that passwords are obtained, this helps prevent cybercrime.

2. Patch management and routine software updates

by fixing known vulnerabilities, system updates lower the possibility of malware and exploits.

3. Training on employee security awareness

by assisting users in identifying phishing, social engineering, and suspicious activity, training helps stop assaults that are caused by human error.

4. Setting up and keeping up firewall and antivirus protection

Unauthorized network access and harmful malware are identified, stopped, and eliminated by these technologies.

5. Frequent backups of data

Backups minimize harm and disruption by ensuring that data can be restored following attacks like ransomware.
